

# NUIX JANUARY 2021 PRODUCT RELEASE

The first Nuix product release of 2021 includes new features across our suite of software that enhance and expand its capabilities across eDiscovery, investigations, and security use cases.

Customers with active licenses with a current support agreement can download the latest version of our software and view detailed release notes on our [Customer Portal](#).

## NUIX WORKSTATION 9.0

Building on the Microsoft 365 connectors introduced in 2020, this release of Nuix Workstation adds the ability to ingest past and present versions of SharePoint documents and the version of any attachment uploaded at the time of a Teams chat, allowing users to compare file versions and preserve chain of custody. Also included is the ability to ingest Modern Attachments, giving users the ability to locate and include the actual file (stored in Microsoft OneDrive for Business) referenced by a Modern Attachment link in an email or chat.

Promoting case data to Nuix Discover<sup>®</sup> from Nuix Workstation now includes the option to promote communication-based items without cumbersome load files. Also, we've added clearer file naming and identification of event logs for MSAB mobile forensic data and additional metadata extraction from deleted Celebrite files. Upgrades to Elastic and OpenJDK 11 provide better security and support for case scaling and custom scripting.

## NUIX INVESTIGATE 9.0

Nuix Investigate<sup>®</sup> 9.0 introduces chat bubble visualizations and the option to color- and icon-code during review. Also included are application framework enhancements that support high availability and horizontal scaling for enterprise-scale investigation and analysis.

## NUIX DISCOVER 10.5 (ON-PREMISES)

Nuix Discover 10.5 for on-premises customers now features names normalization, a highly requested new feature that enables searching, reporting on, and visualizing communications by identity across various email aliases. Names normalization makes eDiscovery, early case assessment, and fact-finding use cases much more efficient.

Also included in this release are a new search term operator as well as issue management enhancements that simplify the creation of nested issues. This addition gives users greater flexibility in organizing and tracking document sets for improved efficiency across tasks.

## NUIX ADAPTIVE SECURITY 2.8

Nuix Adaptive Security 2.8 features two significant additions, beginning with expanded forensic collection options, including sending collections to network shares, collecting to the local disk on the endpoint, and saving collections in a ZIP file for easier sharing.

Threat hunters will benefit from the addition of statistical analysis of events, giving them a valuable tool for detecting outlier behavior across the network. Additionally, we've added audit trail logging to record the actions and activities of software administrators, enhancing internal risk management and security.
