

EXPLORING NUIX ADAPTIVE SECURITY

Nuix Adaptive Security works by capturing events. The endpoint agents will constantly be monitoring various events happening on the endpoint and, based on certain logic rules, will determine what is actually done with those events.

DASHBOARD

The **Dashboard** page is the first page presented when logging into **Nuix Adaptive Security**. The **Dashboard** provides quick and easy access to the most relevant alerts, endpoints, and activity in the environment, and is intended to give users:

- A visual summary of recent alert activity.
- Indicators for how many endpoint agents are part of this deployment, and how many are currently connected.
- A list of the most recent alerts that you can use as a starting point for investigation and response workflow.

ALERTS

The **Alerts** page enables users to continuously monitor and triage alerts generated by the **Nuix Adaptive Security** endpoints.

COLLECTIONS

The **Collections** page is where you can manage, configure, and schedule collections in the **Nuix Adaptive Security** application. You can run targeted collections to obtain specific files from endpoints across the network.

SEARCH

The **Search** page will search endpoints for files or directories. Files can be located using their root path

and the file name or MD5 values. These searches run recursively from a point in the path through the rest of the directory.

INVESTIGATE

The **Investigate** page allows users to see data recorded by the **Digital Behavior Recorder (DBR)** from the endpoints and pushed to the **Nuix Adaptive Security** server.

PROFILES

The **Profiles** page defines the **Agent Settings** and **Logic Rule Set**. Profile settings will vary depending on the selected operating system. Multiple profiles can exist in an environment.

ENDPOINTS

The **Endpoints** page lists all the endpoints currently connected to **Nuix Adaptive Security**. The endpoints appear in the left pane of the page.

EVENT STATISTICS

Event Statistics allow you to view daily event details about the endpoints in your environment. Use **Event Statistics** to create reports on specific analytics in your environment.

TASKS

Use the **Tasks** page to view any job that was created on another tab.
